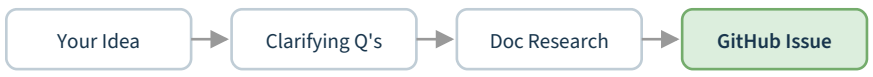
GitHub Feature Workflow with Claude Code

A structured 6-phase workflow for building features or fixing bugs. Each phase is its own session with a clear goal.

1 Ideate — `/wf-ideate`

Turn a rough idea into a well-written GitHub issue.



Session: Fresh · Any model · Plan Mode

"You're the product owner — Claude asks questions and does the research, but the issue is your idea."

2 Plan — `/wf-plan`

Read the GitHub issue and produce a concrete development plan.

Session: Fresh · Best model · Plan Mode

"This fresh start is key — the plan is built from the issue, not from leftover context."

3 Implement — `manual`

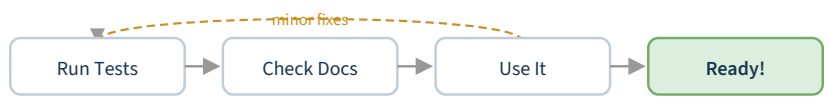
Write the code. Tests first.

Session: Fresh · Best model · Regular Mode

"Find your groove — sit next to Claude and check every change, or let it work and review at the PR."

4 Verify — `manual`

Confirm everything works before staging.

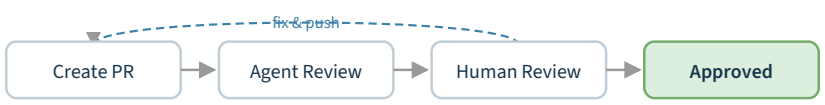


Session: Separate terminal (not Claude Code)

"This is your check, not Claude's. Run the app, read the output, try to break it."

5 Stage — `/wf-pr + /wf-review`

Create a PR, get it reviewed, fix what needs fixing.

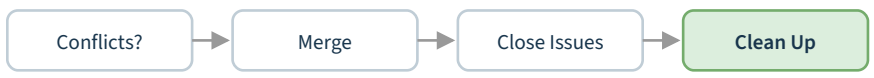


Session: Fresh · Low model (PR) · Best model (review)

"The agent review is a first pass. But you are responsible for the merge. Read the diff."

6 Publish — `/wf-publish`

Merge and clean up.



Session: Fresh (or continue) · Medium model

"If there are merge conflicts, stop — resolve them manually before proceeding."

Fresh sessions. Start each phase fresh — context from a previous phase can bias the next one.

Plan Mode for thinking, regular mode for doing. Phases 1–2 in Plan Mode, phase 3 onward in regular.

Adapt the workflow. A typo fix skips to Implement. A big feature may loop back to Plan.

Issue = handoff. If interrupted, the GitHub issue has everything to pick up later.

Read the plan. Read the PR. Claude does heavy lifting, but quality check is on you.
